## What Mathematics Do Students Need for College? A Data-Informed Discussion

W Gary Martin, Auburn University

Jim Gleason, The University of Alabama
Mariya Rosenhammer, St. Anne-Pacelli

2023 National Council of Teachers of Mathematics Annual Conference Thursday, October 26, 2023 9:30-10:30 AM

## Session Goals

In this session, participants will:

1. Examine data from a survey of university faculty representing different majors about the necessity of a large range of mathematical and statistical topics, including mathematical and statistical practices.
2. Analyze the mathematical and statistical priorities for students in different clusters of majors based on that data.
3. Discuss those priorities in light of the broader purposes of mathematics described in Catalyzing Change and other documents.

## Agenda

1. Introduction and context for the discussion
2. Design of a survey of university faculty
3. An interactive exploration of the results of the survey, including implications for different majors
4. A discussion of next steps and how the findings might be used to further critical conversations about mathematics locally and more broadly

## Revision of the Alabama Course of Study: Mathematics

The committee faced a number of issues as they began to revise the document, including:

1. There was not a clear pathway through or definition of the "required" mathematics content needed by all students.
2. Schools were allowed to spread both Algebra I and Geometry over two years.
3. Eighth grade algebra was creating problems when some students were not making the intended progress.
4. The high school courses had too many standards to teach at the necessary level of rigor.
5. Statistics and data analysis were not meaningfully included in the high school mathematics curriculum.
6. The majority of post-Algebra II courses did not appear to lead anywhere or serve any purpose other than providing students a fourth credit in mathematics.

## Catalyzing Change in High School Mathematics helped guide our response to these issues

Learn more in our chapter from Success Stories from
Catalyzing Change

## Focus for This Talk

The previous Course of Study had too many post-Algebra II courses that did not appear to lead anywhere or serve any purpose other than providing students a fourth credit in mathematics.

## Purposes for Teaching High School Mathematics

Each and every student should [study high school mathematics] in order to:

- expand professional opportunities,
- understand and critique the world, and
- experience the joy, wonder, and beauty of mathematics. (NCTM, 2018, p. 9)

## Our Solution

The subcommittee focused on the professional needs students may have, then used a backwards design process, beginning by identifying potential postsecondary pathways, careers, and opportunities.
The team engaged community stakeholders, future employers, and community college and university professors to determine what mathematics would be necessary for students to be successful in whatever pathway they chose.

Our assumption was that any course we developed should also address to goals of:

- understanding and critiquing the world, and
- experiencing the joy, wonder, and beauty of mathematics.

## "Specialized" Mathematics Courses

- Precalculus -- designed for students entering a major in college for which calculus is required, focusing on prerequisites for studying calculus
- Mathematical Modeling -- designed for students entering a major in college which involves mathematics but not necessarily calculus
- Applications of Finite Mathematics -- designed for students entering a major in college which does not involve mathematics or entering a technical field of study

Each of these courses is designed to prepare students for success in the postsecondary study of mathematics, careers, and their lifelong use and enjoyment of mathematics.

Note that AP Calculus and AP Statistics (and selected other courses) can also be taken for a credit in mathematics.

Course of Study, Appendix B, Chart 2:

## Pathways through K-12 <br> Mathematics to <br> Postsecondary

## The Big Question:

- Our courses are based on the introductory mathematics course required by various majors.
- But are they really the right courses for those majors?
- For example, if these majors do not require calculus, why do they need PRE-calculus?

Engish - History - Pisience - Art
Musicy - Poltucal Sclence - Ant
Sociolic - Foreign Languages
Secondary Education (non-STEM)
Early Childary Education
Architecture - Interior Design
Apparel Design - Exercise Science
Human Development

## Agriscience - Nursing - Forestry

 Animal Science - Fisheries - NutritionBusiness Administration - Accounting Finance - Information Systems Marketing - Supply Chain Mgmt.
Biology - Economics - Food Science Wildite Ecology - Pre Optometry Pre-Med - Pre-Physician's Assistant Pre-Physical Therapy - Pre-Pharmacy
Criminal Justice - Cybersecurity
Engineering (Aerospace, Civil, Materials, Industrial, Sothanical athematics - Mathematics Education Physics - Geology Chemisty

## Meanwhile, back at the ranch...

## ALABAMA GATEWAY MATH OPTIONS GROUP

A working group of post-secondary institutions in Alabama was tasked with re-evaluating the state's mathematics general education requirement.
Based on past research, the group hypothesized that the content of a typical College Algebra course might not align well with non-STEM majors' mathematical needs. However, consensus on what content should be addressed remained elusive.

Consequently, a subcommittee was formed to gather comprehensive data on what mathematics students across different majors should know.

## Purpose of the Survey

To identify the mathematical needs of students in non-mathematics intensive majors.

## Survey Procedure

Step 1. Academic leaders at all two- and four-year IHEs in Alabama were asked to provide a contact name for each degree/certificate program in ACHE's list of degree for which calculus is not a prerequisite.

Step 2. A survey was sent out to each contact asking them to rate the importance of a wide range of mathematics concepts, skills, and processes for students in their program.

## Structure of the Survey

Respondents asked to rate how important 14 areas of mathematics are for students in their program.

- Areas were compiled by looking at syllabi of existing courses, courses in other states, and MAA and ASA standards.

If they rated an area as important or very important, they were asked additional details about that area of mathematics.

## Mathematical areas

- Students will understand properties of functions (domain, range, compositions, inverses) and use algebraic, symbolic, graphical, and numerical techniques to model related contexts and solve related equations.
- Students can analyze the structure of equations or inequalities to determine an efficient strategy to find a solution, if one exists, and then to justify the solution.
- Students can use properties of triangles, circles, and/or trigonometry to solve problems.
- Students should explain and apply basic notions of symbolic logic and analyze arguments by means of symbolic propositional logic.
- Students should understand and be able to use the mathematical language of sets and use this language in different fields of mathematics and in the solving of real-life situations.
- Students can use and create mathematical models involving growth and decay in solving real-world problems involving personal finance.

## Which of the following mathematical practices are needed by students in your degree (or program)?

- Interpreting quantitative information
- Strategically evaluating, inferring and reasoning
- Manipulating mathematical expressions and computing quantities
- Communicating mathematical ideas in various forms
- Make sense of quantitative problems and persevere in solving them.
- Apply the mathematics they know to solve problems arising in everyday life, society, and the workplace.
- Look for patterns and relationships and make generalizations.

## Example

What best describes the importance of the statement about students in degree (or pr Students will understand properties of (domain, range, compositions, inverses algebraic, symbolic, graphical, and nur techniques to model related contexts of equations.Definitely neededSomewhat neededNot needed

## Statistical areas

- Students should become critical consumers of statistically-based results reported.
- Students should be able to recognize statistical questions and design appropriate statistical studies.
- Students should be able to produce and interpret data visualizations, numerical summaries, and statistical models.
- Students should recognize and be able to explain the central role of variability and randomness in the field of statistics.
- Students should demonstrate an understanding of, and ability to use, basic ideas of statistical inference, both hypothesis tests and interval estimation, in a variety of settings.
- Students should be able to interpret and draw conclusions from standard output from mathematical and statistical software packages.
- Students should demonstrate an awareness of ethical issues associated with sound statistical practice.
- Students can use tools and techniques involving the theory of probability to understand the nature of chance and to quantify variation.

## Responses

1,047 surveys were sent (not counting incorrect contacts, not giving permission, etc.) 298 completed responses (meaning they hit the "complete" button, many skipped questions)
Overall response rate: 28.4\%

Response rates by institution varied greatly, from 0\% to 60\%

- $33 \%$ for 4 -years
- $22 \%$ for 2 -years

## Meta-majors

Colleges create meta-majors to group majors with similar interests and prerequisite courses, facilitating students' choices in their first year (Waugh, 2016).
To help account for the potential variations in mathematical and statistical needs across non-calculus majors, we examined these needs within five meta-majors that do not require calculus:

- Data Sciences
- Natural Sciences (not physics, chemistry, or math)
- Social Sciences (including education and public safety)
- Business (includes marketing, and management fields)
- Humanities (languages, arts, communication)

## Degrees by Meta-major

|  | Percentage of <br> Degrees in AL |
| :--- | :---: |
| Calculus-based STEM | $12 \%$ |
| Data Sciences | $4 \%$ |
| Natural Sciences (not physics, chemistry, or math) | $20 \%$ |
| Social Sciences (including education and public safety) | $25 \%$ |
| Business (includes marketing, and management fields) | $22 \%$ |
| Humanities (languages, arts, communication) | $15 \%$ |
| Other | $1 \%$ |

## Data Analysis

- We set the null hypothesis to be that half of the programs would report that their students need a given topic and half would not.
- Simplified to Yes/No
- We then computed a two-tailed test of the null hypothesis with a level of significance of $\alpha=.05$.
- If a proportion of programs in a meta-major is less than $50 \%$ and the corresponding two-tailed p-value is less than 0.05 , then we will say that that topic is not needed by most programs in that meta-major.
- If the proportion of programs in a meta-major is greater than $50 \%$ and the corresponding two-tailed p-value is less than 0.05 , then we will say that the topic is needed by most programs in that meta-major.

## Results for Mathematical Topics

Find some people near you, then....
PREDICT: Which of these topic areas will be needed by students in different
 meta-majors? (Mark those that you think are a high need.)

|  | Properties and applications of Normal distributions | $88 \%$ | $87 \%$ | $85 \%$ | $73 \%$ | $35 \%$ |
|  | Properties and applications of Uniform distributions | $88 \%$ | $76 \%$ | $78 \%$ | $67 \%$ | $25 \%$ |
|  | Central Limit Theorem | $63 \%$ | $58 \%$ | $39 \%$ | $50 \%$ |  |
|  | Have a mathematical understanding of "random" (rather than <br> haphazard or unplanned) | $81 \%$ | $74 \%$ | $65 \%$ | $63 \%$ | $27 \%$ |
|  | Role of random assignment in comparative experiments | $63 \%$ | $63 \%$ | $63 \%$ | $40 \%$ | $17 \%$ |
|  | Difference between correlation and causation | $88 \%$ | $84 \%$ | $85 \%$ | $77 \%$ | $38 \%$ |

## Statistical Inference

| Students should demonstrate an understanding of, and <br> ability to use, basic ideas of statistical inference, both <br> hypothesis tests and interval estimation, in a variety of <br> settings. | Data <br> Sciences | Natural <br> Sciences | Social <br> Sciences | Business | Humanities |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | $88 \%$ | $82 \%$ | $87 \%$ | $93 \%$ | $42 \%$ |
|  | Generating and using simulations with software | $50 \%$ | $45 \%$ | $35 \%$ | $53 \%$ |
|  | Hypothesis Testing | $81 \%$ | $66 \%$ | $76 \%$ | $77 \%$ |
|  | Confidence Intervals | $75 \%$ | $74 \%$ | $63 \%$ | $77 \%$ |
|  | p-values | $69 \%$ | $74 \%$ | $63 \%$ | $67 \%$ |

## Statistical Software

| Students should be able to interpret and draw conclusions <br> from standard output from mathematical and statistical <br> software packages. | Data <br> Sciences | Natural <br> Sciences | Social <br> Sciences | Business | Humanities |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | SPSS | $100 \%$ | $84 \%$ | $78 \%$ | $97 \%$ | $33 \%$ |
|  | R | $50 \%$ | $45 \%$ | $50 \%$ | $43 \%$ | $10 \%$ |
|  | Graphing calculators | $44 \%$ | $42 \%$ | $9 \%$ | $17 \%$ | $2 \%$ |
|  | SAS | $44 \%$ | $26 \%$ | $9 \%$ | $23 \%$ | $4 \%$ |
|  | Spreadsheets (i.e. Excel) | $38 \%$ | $26 \%$ | $7 \%$ | $3 \%$ | $2 \%$ |
|  | LISREL | $94 \%$ | $82 \%$ | $57 \%$ | $73 \%$ | $17 \%$ |
|  | MATLAB | $0 \%$ | $0 \%$ | $0 \%$ | $3 \%$ | $0 \%$ |
|  | Maple/Mathematica | $38 \%$ | $21 \%$ | $2 \%$ | $3 \%$ | $0 \%$ |
|  | Stata | $0 \%$ | $0 \%$ | $0 \%$ | $0 \%$ | $0 \%$ |
|  | StatKey | $13 \%$ | $0 \%$ | $17 \%$ | $0 \%$ | $2 \%$ |
|  | Other | $0 \%$ | $0 \%$ | $0 \%$ | $0 \%$ | $0 \%$ |
|  |  | $19 \%$ | $5.3 \%$ | $4 \%$ | $10 \%$ | $2 \%$ |

## Statistical Ethics

| Students should demonstrate an awareness of ethical issues associated with sound statistical practice. | Data Sciences | Natural Sciences | Social Sciences | Business | Humanities |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 94\% | 100\% | 91\% | 97\% | 79\% |
| Application of proper data collection principles of such as human subjects review and informed consent. | 69\% | 68\% | 85\% | 43\% | 63\% |
| The difference between using statistical methods to inform decisions and abusing data to justify foregone conclusions | 94\% | 95\% | 80\% | 90\% | 63\% |
| Understand influence and role of confounding variables. | 75\% | 79\% | 72\% | 53\% | 33\% |
| Understanding impact of multiple testing on false positive rates. | 69\% | 66\% | 52\% | 40\% | 23\% |

## Probability

| Students can use tools and techniques involving the theory of probability to understand the nature of chance and to quantify variation. | Data Sciences | Natural Sciences | Social Sciences | Business | Humanities |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 94\% | 84\% | 72\% | 77\% | 33\% |
| Calculate probabilities by applying probability laws and theoretical results. | 88\% | 53\% | 52\% | 50\% | 17\% |
| Use the rules of probability to compute probabilities of compound events in a uniform probability model. | 69\% | 24\% | 20\% | 33\% | 13\% |
| Calculate expected values and use them to solve problems | 75\% | 61\% | 30\% | 63\% | 23\% |
| Identify an appropriate probability distribution for a given discrete or continuous random variable and use its properties to calculate probabilities. | 44\% | 32\% | 28\% | 43\% | 15\% |
| Understand independence and conditional probability and use them to interpret data. | 56\% | 29\% | 35\% | 47\% | 21\% |
| Derive probability distributions of functions of random variables. | 44\% | 32\% | 13\% | 23\% | 13\% |
| Apply results from large-sample theory and the Central Limit Theorem to approximate a sampling distribution. | 50\% | 26\% | 30\% | 27\% | 13\% |

## Data Analysis and Statistics Topics

|  | Data Sciences | Natural Sciences | Social Sciences | Business | Humanities |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Data Analysis <br> Consumers | Needed | Needed | Needed | Needed | Interpret displays <br> and analyses |
| Statistical <br> Questioning | Needed | Needed | Needed | Needed | Not likely |
| Data Displays and <br> Computations | Needed <br> (with technology) | Needed <br> (with technology) | Needed <br> (with technology) | Needed <br> (with technology) | Not needed to <br> create |
| Variability | Normal Distributions <br> Correlation/Causation | Normal Distributions <br> Correlation/Causation | Normal Distributions <br> Correlation/Causation | Normal Distributions <br> Correlation/Causation | Not likely |
| Statistical Inference | Needed | Needed | Needed | Needed | Not likely |
| Software | Spreadsheets+ | Spreadsheets | Spreadsheets | Spreadsheets | Not needed |
| Statistical Ethics | Needed | Needed | Needed | Needed | Needed |
| Probability | Needed | Some | Some | Some | Not needed |

## Conclusions for Statistics?

How did the results compare to your predictions?
What conclusions can you draw?

## Discussion Questions

1. What are the implications of this work for what should be included in higher education general education mathematics courses?
2. What are the implications of this work for what is emphasized in high school mathematics?
3. How can we maintain a proper balance among the goals for study mathematics, both at the high school and post-secondary levels?

- expanding professional opportunities,

## as well as

- understanding and critiquing the world and
- experiencing the joy, wonder, and beauty of mathematics.

4. How can we expand communication between high school and post-secondary mathematics instructors to better meet the needs of our students?
